Primed Only Products

Remmers water-based product ZW-425 can be used as primer coat for external joinery items and provide a limited protection to the timber against handling marks and moisture during transport and initial fitting stages. The joinery items must be fully coated with a complete microporous system as soon as reasonably practicable.

Primed only products will not provide adequate protection from the elements to timber joinery items for prolonged periods.

A fully coated microporous system sheds any excessive moisture and allows the timber to breathe and stabilise to a natural moisture content.

Timber joinery items that are primed only for prolonged periods will allow excessive moisture content variances both above and below the recommended 15-18% for external joinery . These excessive variances will swell and shrink timbers promoting faults such as warping, twisting and splits to the timber. This is particularly problematic for dimensionally stable joinery items such as windows, doors and frames.

Remmers do not offer any coating warranty to products that are primed only.

Kind Regards
